

A private medical practice asks you to create a dashboard to help them better understand their patients. Specifically, they want to know more about patient retention and how they can best serve their patients' medical needs.

Your contact at the private practice wants to answer the following questions:

What is the frequency of visits from returning patients? For example, how many times do the same patients visit in a year? How many times do the same patients visit in five years?

What is the average length of time between visits per patient?

How many patients are visiting a specialist for a specific condition? How does their visit frequency differ from patients who are only at the practice for general visits and aren't visiting a specialist?

What are the results of the five-question surveys that patients are asked to complete after each visit? How many patients complete them? Do the patients who complete them have anything in common?

Considering that the goal of the dashboard is to help improve the way this practice treats its patients, draw a low-fidelity mockup to represent the visual approach you'd take.

what is the dashboard supposed to do?

Ans: the stakeholder wants to know more about patient retention and how they can best serve their patients medical needs.
